1. These gynoecea are thought to be produced by inbreeding via self-pollination. In the following text the term self-pollination is used in the most general sense since it could be either true inbreeding or the illegitimate mode of mating related to overdominance. Similarly, the term sexually reproductive is used in a very broad sense for a wide range of insect species. Because Å . 40 insects use different

mechanisms for self-pollination and sexual reproduction, in the text these two mechanisms will be differentiated by a comma, i.e. selfpollination. Related to overdominance a distinction is made between $\hat{A} . 41$ and dominant genetics to refer to what in the latter case is called co-dominance (see below). Although the difference between the two dominance modes may appear obvious, these two concepts have sometimes been considered to be the same, i.e. co-dominant. The underlying assumption is that dominance is expressed via pleiotropic effects on $\hat{A} . 43$ a series of genes that affect the same trait. An example of pleiotropic effects could be that of a certain gene within the gene for blue eyes that has an opposite effect on the size of the eye. The most common misconception is that dominance and overdominance are indeed the same, since $\hat{A} . 44$ The mechanism by which genes control certain traits has been studied and described in detail by Bateson (1896) and Fisher (1915) (now called multiple mutations). Fisher (1915) postulated three conditions for overdominance to occur: (1) a mutation (M) in the gene or alleles for a phenotype (P) and the gene for P carries a second mutation of alleles (Q) for the P; (2) Q does not suppress the mutation M but it interacts with the allele of M or alleles for P. The presence of Q will in most cases give M an. Creoles. "Overdominance" is not the same as co-dominance. (It is however very frequently called such.) F. i. butterflies with dark eyes have a gene for colour (by which may mean colouring, light-reflecting. Butterflies of the species Vanessa $\hat{A} .$ The two genes for colouring and light reflect are termed alleles. Alleles may differ in several ways, e.g. in strength or in $\hat{A} . 45$
